

Inline Services manufactures aluminum gauging plates in a variety of sizes. Gauging plates are used on pigs specifically configured for pipeline gauging. Pipeline gauging pigs identify internal defects such as dents, debris or other internal restrictions that affect the I.D. of the pipeline.

While traversing the pipeline, if the gauging pig passes through obstructions or restrictions, the plate will show wear in its otherwise flat profile. Examining the wear or deflections on the plate and tracking the pigs location allows for isolating problem areas in the line.

Options Available:

- Slotted or Unslotted
